

The team interviewed more than 100 students on their campus, to understand the habit of littering and its major causes. The two main reasons that made the students not want to put garbage into the litter bins were:

1. Absence of recycle bins in the campus.
2. And the ones that existed where not properly maintained.

The project will improve the distribution of garbage cans in the campus and also build a classification system, which will classify the recyclable garbage and the others. The money collected from the selling the recyclable garbage will be used in further execution of the project.

Project implementation:

1. The team members were divided into smaller groups. There were basically two main groups, the Design Group and the Interview Group. Design Group re-created and improved the bins by designing and decorating them with mini-posters to raise people's awareness.
2. The bins helped in segregation of waste and later using them for recycling or reusing purposes.
3. The Interview Group designed a questionnaire for an online interview form so as to gather opinions from other students in their university. Based on interview results, they extracted the insights, which helped them orientate the needs of students in their campus.
4. The recyclable trash was sold for a small amount of money which was used for funding further student volunteering activities.

This project aims to improve the awareness of students in the campus about classifying garbage. After making the project successful in heir Campus, the team wishes to expand this campaign to other Universities and Campuses in Vietnam.
